BAN 501

Module 1 Project A

Project Name	Marketing Campaign Budget Allocator
Project Due Date	Sunday by 11:59pm

Objectives
- Practice working with variables, data types, and operators.
- Implement conditional statements and loops to make decisions and repeat tasks.
- Perform basic calculations and manipulate data.

Steps
1. Planning:
   - Define three marketing channel variables (e.g., social_media, email_marketing, advertising).
   - Assign a budget limit to each channel as an integer (e.g., social_media = 5000, email_arketing = 3000, advertising = 2000).
   - Identify two factors influencing budget allocation:
     - target_audience (options for target audience could include "Gen Z", "Millennials", "Gen X")
     - campaign_goal (options for campaign goal could include "Brand Awareness", "Lead Generation", "Sales")
2. Coding:
   - Start by introducing variables to store user input:
     - user_target_audience = input("Enter your target audience (Gen Z, Millennials, Gen X): ")
     - user_campaign_goal = input("Enter your campaign goal (Brand Awareness, Lead Generation, Sales): ")
   - Implement an if statement to branch based on the selected campaign_goal:
     - If Brand Awareness:
       - Increase the "Social Media" budget by 20% (5000 * 1.2).
       - Increase the "Advertising" budget by 15% (2000 * 1.15).
     - If Lead Generation:
       - Increase the "Email Marketing" budget by 30% (3000 * 1.3).
     - If Sales:
       - Increase each of the three budgets by 10%.
   - Calculate the remaining budget by subtracting the sum of all channel budgets from the initial total budget (sum of all base budget values).
3. Testing and Refinement:
   - Test the program with different combinations of user_target_audience and user_campaign_goal.
   - Add comments to explain your code logic and improve readability.
4. Optional Enhancements:
   - Display the allocated budget for each channel and the remaining overall budget in a visually appealing format. Display the allocated budget for each channel and the

remaining overall budget in a visually appealing format. (Allocated budget is the new amount. Overall budget is the allocated amount subtracted by the original amount.)

-
- Implement a menu system to navigate different functionalities (e.g., budget allocation, budget overview).
- Integrate real-world data like average costs for different marketing channels or historical campaign performance.

Additional Tips
- Use mathematical operators and calculations directly within your conditional statements.
- You can create separate variables to store the adjusted budgets for each channel before subtracting them from the total budget.
- Focus on clear code structure and indentation to make your logic easier to understand.

Grading Criteria
1. This project will be graded on an A*-F* scale (see the syllabus for details). To get high marks on this project, you must complete all requirements and have the project function perfectly.
